Weiguo Lao

School of Life Sciences
University of Technology Sydney

2018

Certificate of Original Authorship

I, Wei Guo Lao declare that this thesis, is submitted in fulfilment of the requirements for the award of Degree of Doctor of Philosophy, in the School of Life Sciences at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise reference or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution. This research is supported by UTS Research Excellence Scholarship (RES) commencing Autumn 2013. This scholarship comprises of an Australian Postgraduate Award (APA) Scholarship funded by the Australian Government.

Signature: Production Note:
Signature removed prior to publication.

Date: 10.10.2018

Acknowledgements

I have made great efforts in this project, which would not have been possible without the kind support and help of many individuals and organizations; I would like to extend my sincere thanks to all of them.

My first vote of thanks goes to my principal supervisors, Professor Xianqin Qu for her guidance, encouragement and patience over the years of my PhD journey. I count myself fortunate to have the opportunity to work on this project with you. I hope that I will still be able to turn to you for your advice throughout my career in science. I have learnt a lot from you, in particular your intellectual curiosity, endless quest of scientific observations and attention to details. Also thank you to my co-supervisor Associate Professor Christopher Zaslowski for his support and guidance throughout my studies too.

I would also like to thank Dr. Yi Tan, Dr. Linda Xiao, Dr. Michael Johnson, Dr. Xingliang Jin, Dr. Matthew Padula and Dr. Jerran Santos. You not only help me to build up my research skill, but also provided valuable advice to my thesis and publications. Also, many thanks to the friends of level 7 I have met along the way, Harry, Mercedes, Sara, Luke and Maddie, I can't finish my lab work and writing without your wonderful support.

To Dr. Andy Liu, I thank you for your positive encouragement, enthusiasm and support in my laboratory work and studies. It is my honors to be your student and working with you in Douglass Hanly Moir Pathology.

Finally, I would like to thank my family (esp. my parents, my wife Yan and my children) and friends for all their love, concern and company. Thank you for helping me to get through the toughest times of my life.

Abstract

Obesity is a metabolic disease with high risk of severe complications, including type 2 diabetes, cardiovascular disease, and cancer conditions. To develop natural approaches to obesity-associated metabolic complications a series of *in vitro* studies were conducted to evaluate effects of green tea polyphenols (GTP) on cellular dysfunction related to the development of obesity and its complications.

Increased differentiation of adipocytes from preadipocytes contributes to fat mass expansion and leads to obesity and type 2 diabetes. The effects of GTP on fat cell differentiation and lipids accumulation were investigated in Chapter 3 using 3T3-L1 preadipocytes. The results demonstrated that GTP suppressed the differentiation of 3T3-L1 preadipocytes into mature adipocytes through down-regulating adipogenic regulators of PPAR γ , C/EBP α , and SREBP-1c at gene expression and post-transcriptional level. The findings from this study suggest that GTP can combat unnecessary adipogenesis at the cellular level to prevent obesity and subsequently reduce the risk of type 2 diabetes and cardiovascular disease.

Accumulating evidence demonstrated an increase of adipogenesis accompanied by osteoporosis in obese populations. Adipocytes and osteoblasts originate from a common ancestor, pluripotent mesenchymal stem cells. Based on the anti-adipogenic effect of GTP, the study in Chapter 4 investigated whether GTP possesses the ability to limit human adipose tissue-derived stem cells (hADSCs) differentiation to adipogenic lineage and concomitantly enhance osteogenesis. The study utilising hADSCs and PPAR γ agonist identified PPAR γ and Runx2 as essential regulators involved in adipogenesis and osteogenesis, respectively. GTP treatment inhibited ADSCs differentiation to mature adipocytes and promoted osteogenesis through suppressing the PPAR γ -induced adipogenesis and upregulating Runx2-Bmp2

mediated osteogenic pathway. Therefore, the enhancement of osteogenesis with preventing adipogenesis with GTP may provide a rational approach towards developing GTP as multifaceted therapeutic goods for the intervention of obesity-associated osteoporosis.

Polycystic Ovarian Syndrome (PCOS) is a complex of the metabolic and reproductive disorder. Obesity associated with insulin resistance plays an important role in excessive androgenesis by ovarian theca cells. Based on our observations that GTP is capable of enhancing insulin-mediated glucose and lipid metabolism with anti-obese effect study in Chapter 5 investigated whether GTP would be able to alternate ovarian cell dysfunction led abnormal steroidogenesis using dexamethasone-induced hyperandrogenism in primary thecal cells from female mice. GTP treatment inhibited over-secretion of testosterone in theca cells through downregulation of the expression of the cytochrome P450 17 α -hydroxylase (CYP17A1) additionally reduced CYP11A1 expression at the high concentration (25 μ g/mL). These findings provide scientific evidence to support the use of GTP for ovarian dysfunction leading to hyperandrogenism in PCOS.

DNA methylation is essential for healthy development and is also involved in aging and carcinogenesis. The recent study using genome-wide DNA methylation analysis has identified hypermethylation as a potential epigenetic change of obesity-related cancer. Based on the antiadipogenic effect of GTP during ADSCs differentiation, the study in Chapter 6 evaluated the effects of GTP on DNA methylation in deferent passages of ADSCs. This study discovered GTP enhanced DNA methyltransferase 1 (biomarker of DNA methylation) expression without changing MYC expression at early stage of ADSCs passages and downregulated DNMT1 expression at passage 12 of ADSCs culture. These findings suggest GTP possesses dual regulatory effects on DNA methylation during ADSCs expansion with genomic stability, which highlights the potential use of this naturally occurring compound in

ADCSs expansion for regenerative medicine without carcinogenic risk.

In summary, *in vitro* studies conducted in this thesis have demonstrated beneficial effects of and molecular mechanisms of GTP on obesity and obesity-associated osteoporosis and PCOS. To gain deeper insight into therapeutic application of GTP for obesity and its metabolic complications, the animal studies and clinical trials are warranted in the future study.
